**BATTERY WITH VIBRATION-RESISTANT JOINT BETWEEN
POSITIVE ELECTRODE AND CURRENT CARRYING STRAP**

Examiner: Z. Best S.N. 10/511,997 Art Unit: 1795 August 19, 2008

DETAILED ACTION

1. Applicant's amendment filed on July 1, 2008 was received. The specification of the invention was amended. Claims 1-19 are pending.
2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Specification

3. The objection on the specification is withdrawn because the abstract has been amended.

Claim Rejections - 35 USC § 103

4. The claim rejections under 35 U.S.C. 103(a) of Claims 1-19 are withdrawn because Applicant's argument was persuasive.

Allowable Subject Matter

5. Claims 1-19 are allowed. The invention of independent Claim 1 recites a method of manufacturing a battery, comprising: providing a cell for a battery having alternating positive and negative electrode plates, each of the positive and negative electrode plates being separated by an electrically insulative separator layer, the positive and negative electrode plates being in overlying relationship, wherein each of the positive electrode plates includes a projecting tab extending from an adjacent upper portion thereof, the projecting tabs of the positive plates being generally aligned, and wherein each of the negative electrode plates includes a projecting tab, the projecting tabs of the negative plates being generally aligned; attaching a conductive connecting strap to the projecting tabs of the positive electrode plates; applying a cap material to portions of the projecting tabs and the adjacent upper portions of the positive plates; and allowing the cap material to harden to provide a cap attached to the projecting tabs and the adjacent upper portions of the positive plates. The invention of independent Claim 14 recites a battery, comprising: a housing; a plurality of alternating positive and negative electrode plates, each of the positive and negative electrode plates being separated by an electrically insulative separator layer, the positive and negative electrode plates being in overlying relationship and positioned in the housing, wherein each of the positive electrode plates includes a projecting tab extending from an adjacent upper portion thereof, the projecting tabs of the positive plates being generally aligned, and wherein each of the negative electrode plates includes a projecting tab, the projecting tabs of the negative plates being generally aligned; a conductive connecting strap attached to the

projecting tabs of the positive plates; a conductive connecting strap attached to the projecting tabs of the negative plates; and a cap covering portions of the projecting tabs and adjacent upper portions of the positive plates.

The closest prior art of record, Hasegawa et al. and Nakano, does not teach a cap covering portions of the projecting tabs and adjacent upper portions of the positive plates or the process step of allowing a cap material to harden to provide a cap attached to the projecting tabs and the adjacent upper portions of the positive plates as recited in Claims 14 and 1, respectively. The documents cited to be particularly relevant from the International Search Report similarly fail to teach the aforementioned claim limitations.
